CESSATION AND THE WAY THEREETO
(Nirodha-Maga)

Prof. P.C. Vogel

Even in this very body there lies the cessation of the world, and the way leading to the cessation there of. Now if there is an origination process by way of dependence on links (Paticca-Samuppada) and causes, it is also complemented by an inverted cessation (niruddha) process. If this were not so, then there would surely be no loophole out of the round of birth and death in the world-spheres, without end.

The way to cessation is, of course, well known. Namely, the Noble Eightfold Path; otherwise condemned under the categories of morality (Sila), concentation (Samadhi), and wisdom (Panna).

The function of morality is to purity, concentration to penetrate, and wisdom to liberate. In that they are a unity, linked in a chain, because they do not prosper without each other's support. Morality devoid of concentration is conducive to delusion, concentration devoid of morality is conducive to a dangerous inflation, and wisdom devoid of concentration is conducive to deficiency of mind control. As it is said:

"Great becomes the fruit. Great the advantage of concentration when it is encompassed by morality. And great the fruit and advantage of wisdom when encompass by concentration. The mind encompassed by wisdom leads to the removal of delusions."

The term 'cessation' in this context may lead one to suppose that annihilation of the consciousness-subject is the goal. It is to be observed, however, that the process, beginning with mor-nay, culminates in wisdom and emancipation of mind. This therefore, in
no way implies the extinction of a conscious subject. As it is said: "All corruption shall be put away, and wholesome things brought to increase."

What is corruption? The three ets of delusion (Moha), hate (Dose), and greed (Lobha). What is wholesome thing? The Noble path, called the best of paths, for unlike other paths it leads to emancipation of mind.

Gestuation in this context, therefore, does not imply decrease but increase. And if this is difficult to comprehend, then it is the wisdom of the sage which claims that one possessing nothing possesses all. The 'increase' in this context is the priceless gem which is termed as 'the sure heart's release'. As it is said:-

"Even the ocean is absorbed with only one great taste, the taste of salt. So this discipline and doctrine which I teach is absorbed with only one great taste, the taste of release."

Although the path begins with morality, the emphasis in the following chapter will be on concentration. Morality is already well known, whereas concentration remains an extremely complex and involved subject. In any case, morality, concentration, and wisdom are so intricably involved that they emerge in relation whenever one is added to. For the present, it may be mentioned that there are three kinds of defilements (kilesa): that kind which translates itself immediately into word or act (vinikamika kilesa), that which arises and then subsides (Pariyutthana kilesa), and that which is always latent (amsayaiklesa). Of these the last name is the most devious to erase. It comprises seven wholesome tendencies: Sensuality (kamaraga), attachment to becoming (bhavaraga), malice (patigha), biasness (adhistha), conceit (Maha), doubt (vicikiccha), and ignorance (avitta). These defilements are subdued (Pahanu) by three methods: by substitution of opposites (tuadha pabaha), by tranquillisation techniques (abhiphandha pahana), and by insight (Samuccheda pahana). In other words, by morality (sila), by concentration (Samadhi), and by wisdom (Panna).

Samadhi (concentration): Concentration may be analysed into four categories:

1. The concentration for the attainment of jhanas (absorptions), (2) the concentration for the attainment of nana dassana (extrasensory perception), (3) the concentration for the attainment of sathasampanna (intent awareness), (4) the concentration for the attainment of vipassana nana (penetrative insight).

Jhanas (absorptions) derived from concentrated tranquility of body and mind are highly conducive to states of equanimity and bliss. In view of this, these concentrated absorptions are only too susceptible of being grasped as ends in themselves, when in reality they are only to be regarded as a means to an end, and as such merit a primary and distinguished place.

(2) Nana dassana (extrasensory perception) is that faculty of perceiving things which are astral in nature. Devoid of this supernormal vision, the human horizon is inevitably constrained within the limitations of the five sense-organs, to say the least. However, the attainment of supernormal vision is taken as an end in itself, when in fact it is only a means.

(3) Sat sampajanna (intent awareness) is that faculty of mindfulness and awareness which requires for keeping the mind in harness and under restrained control. Without this incessant control over formations, feelings, perceptions, and concepts,
Consciousness is led astray momentarily as the victim of every incident that upsprings. However, mind-controlled itself is insufficient to be regarded as an end, for although it keeps a constant vigil over random-effervescent, it does not however annihilate them at the source. At best, it serves as a preventative and defensive device.

(v) Vipassana nowa (Penetrative insight) is that faculty which penetrates to the source. As long as this faculty is attained the mind is not in a position to comprehend or understand the scheme of all things in the visible and invisible universe. Without this objective vision, consciousness is dominated by its own limited subjectivity and personal prejudice. It is, finally, only through this faculty that the unrealised, potential becomes the actualised reality. Thus is, the ultimate integration of personality and its unrestricted release.

These four categories of concentration, however, may be resolved under the collective term of Samatha-vipassana (tranquilized-penetrative insight), and shall be dealt with as such.

**Samatha-vipassana (Tranquilized-penetrative insight):**

Samatha is that quality of tranquilization so necessary as an integral process and also because of its being the essence. Its function, by tranquilizing, is to dispense passion (rāga). In view of the fact that passion clouds the mind, and that the mind is by its very effervescence flitted away from second to second, the only method of integration is by concentrating attention to a point (ekaggata).

There are numerous methods of achieving this, and they need not be detailed here. The thing of prime importance is to fix the mind to a centre, and to keep it there. Once the hectic effervescence of the psyche is controlled to an integral point, it may be expanded later to embrace a vast field. It is to be noted that the Satipatthana Sutta begins with the Samatha factor.

"Herein, O Bhikkhus, a bhikkhu hasing gone to the forest, to the foot of a tree or to an empty place, sits down with legs crossed, with body erect, and sets up mindfulness in front".

Now the mind cannot (without first having been trained to do so) fix its attention upon any particular thing for a protracted period, whether the 'thing' be body, feelings, thought, or objects of mind. To alleviate this difficulty, therefore, some form of tranquilisation involving either one of the forty-eight subjects of Samatha Kammatthanaya, is recommended, according to individual congeniality. Only after the mind has become steadied, made lucid and firm, is it directed to the investigation of the body, feelings, thoughts, and objects of mind.

Although concentrated-absorption (jhana) is a product of Samatha, it does not necessarily imply extrasensory perception (nana dassana). There may be extrasensory perception or there may not, since tranquillity is not concerned with perception but with tranquillity. If extrasensory perception is to be cultivated, the potential faculties of vision (Gakhandantrya) have to be developed by concentration on the light kasina. And this is so because, even as light illumines a dark room, even so in accordance with the principle of optics the darkness of the psyche within has to be first illuminated by an
internal light.

Vipassana: Whereas the function of Samatha is to tranquillize, the function of Vipassana is to dispense ignorance (Avijja) and to penetrate. Samtha and Vipassana, although they may be practiced in isolation, do not prosper without each other's support. For Samatha in no way dispenses ignorance, nor is there vipassana without the tranquillity of body and mind at first. When combined and developed, they result in the attainment of knowledge (Vijja) and the render the defilements (Asava) extinct.

Vipassana's scope includes ten insights, as follows:-

(1) Sammasana Nana: Perceptive insight into the factors of intangibility (Nana) and formations (Rupa) in their true perspective and nature.
(2) Udjayabhayanu Passana Nana: Perceptive insight into the arising and perish- ing of all tangibility and intangibility from one moment to the next.
(3) Bhanganu Passana Nana: Perceptive insight into the dissolution of all phe- nomena.
(4) Bhayapathana Nana: Perceptive insight into what are the dangers to be feared and shunned.
(5) Adinavaru Passana Nana: Perceptive insight into the misery inherent in all things and rooted in grasping.
(6) Nabhodaya Passana Nana: After perceptive insight into the above five factors, the consequent aversion arising there from as a preparatory stoppage leading to release.
(7) Mucittakanyata Nana: Perceptive insight into the yearning for release through the right path.
(8) Patissankha Passana Nana: Perceptive insight into the discriminative con- templation, whereby release may be obtained, though obstructed by the grasping ag- gregates.
(9) Sankharapajaka Nana: Perceptive insight into the equanimity where all the formations are to viewed as preparatory to the attainment of release.
(10) Anuloma Nana: Perceptive insight into the adaptability of life, whereby release may be obtained. That is, comprehension of the Four Noble Truths in all their ramifications, and the development of middle path surpassing both asceticism and sensuality extremes.

The Discourse on mindfulness continues:-

"Thus he lives contemplating form in form internally, or externally, or internally and externally. He lives contemplating origination factors in form, or dissolution factor, or both. Thus he contemplates form in form, feelings in feelings, thoughts in thoughts, and mental essences in mental essences".

Now to contemplate origination and dissolution factors, in Buddha's sense, scarcely implies a didactic reflection upon the decay and death of the body, but of the
internal structure of the life process itself, witnessed in full clarity by penetrative insight.
As it is said:-

"As long, O Bhikkhus, as my vision pertaining to the Noble Truths, with triple
insight and in twofold style, remained unclear, even so long, o Bhikkhus, as this
world with its Maras, Brahmans, ascetics, gods, and men of highest insight and know-
ledge remained to be attained".

The 'triple insight' referred to the perceptive insight into things as they are (Sacca
Nana), the perceptive insight into something which has to be accomplished and
known (Kicca Nana), and the perceptive insight into something which has been ac-
complished and known (Kata Nana). Each noble Truth penetrated in this way and
makes for the twofold style.

It is obvious that the physical eye is not implied here, since it does not penetrate
into the body, not to mention mental essences, but the eye of purified intensity pertaining
to the Dhammakaya. But what is this Dhammakaya? To understand the implications
it is necessary to return to the ancient adage:-

"Self is the refuge of self".

At a casual glance, this contradicts the doctrine of Anatta. How can self be the
refuge of self when there is no self? But the seeming contradiction is merely of superfi-
cial one, and appears as a contradiction due to us having been shifted out of context,
Life is beset with impersonality because the five aggregates of an individual field are
facile and not self-controlled, an effervescence that splits and re-splits.
Nevertheless, even a personality which splits is still a personality, and if properly
controlled may even attain to the height of altitude. As it is said:-

"Be unto yourself a refuge, an isle, and not elsewhere.
Let the dhamma be refuge, the isle, and not elsewhere.
Thus shall the limit of darkness be reached, for those who are desirous to learn".

If there is going to be any sort of self at all, it is obviously this Dhamma which will
have to be established as such. And since equilibrium of consciousness is the very
essence, the way to mental poise is not to disregard the peripheral faculties of incessant
external elements, but to establish them at the same internally centralized point.

As it happens, this problem is already solved by nature (Dhamma). For in the
human debris of personality such an integrated point already exists, namely in the pit of
the diaphragm, and seated at which point is a nucleus (sphere) of Dhamma. Were it
not for this nucleus, wherein all the four elements and consciousness fuse, the human
organism would never have come to exist. This sphere of Dhamma serves as the base
for the manifestation of organic human personality as such, and is termed Pathama
Magga (First step).

Now as soon as the life is issued from the mother's womb, it begins the gradual
process of sense-contact (Phassa) with the environment, activating along the network
of nerves, which culminates in the attention being directed to the external form, thereby
establishing and identifying it as the self.

As for the nucleus of Pathama Magga at diaphragm level, it passes from sight,
because from birth onwards all men's activities are centred outside, not inside. When
the peripheral faculties are withdrawn from external contact and centered within, the initial attempt is seldom crowned with success, considering that perception through protracted externality of contact has become crassified and gross. Initial attempts at introverted perception usually result only in a sensation of swimming and whirling in the dark.

What is more, once the nucleus of Pathama Magga is perceived, it is too small and effervescent to fixate attention thereon for long. This is significant regarding the habitual hectic state of the peripheral mind. Initial attempts are always tangled up at this point, and the problem is always how to fix attention upon the nucleus of light and keep it there. As it is said: "There are three factors necessary, O Bhikkhus, for one intent on the attainment of higher consciousness (Adhicitta). Namely, the factors of concentration, of energy, and of equanimity, are the three factors. If, O Bhikkhus, only the factor of concentration is applied, then consciousness is conducive to laxity. If only the factor of energy is applied, then consciousness is conducive to that state which is devoid of the potential necessity for the destruction of the delusions. But if, O Bhikkhus, concentration, energy, and equanimity, in proportion as the need for them demands, are initiated, then consciousness becomes flexible, potent, and translucent, so as to initiate the destruction of that which is defined. Thus only does it attain to the capacity of beholding in perceptive immediacy the state or circumstance at which it is aimed."

Now once the peripheral faculties have been sunk and gravitated to the pit of the diaphragm (slightly above navel) and the sphere of Pathama Magga manifests translucent and bright, it is to be understood that in this sphere the aggregates (Saddhatthas) have their seat. It is a process of nature to aggregate in spheres as a repository self-contained. If the aggregates are not integrated and condensed thus, they would disintegrate and disperse, and memory as such would no longer exist, not to mention selfhood. Also, if penetrated in detail, in this sphere of Pathama Magga lies the aggregates of morality, concentration, and wisdom, which pertain to the human personality, and which have been accumulated from antediluvian lives. It is not enough, however, that these aggregates or spheres of morality (sila), concentration (Samadhi), and wisdom (Panna), are discovered. They have to be developed and purified. Therefore they are called accomplishments (Sampadas). They are the steps to the fashioning of the integrated personality, which is a matter to be accomplished strenuously, and not something given and ready-made.

This is made plain by the exhortation: "We will not shrink back but will struggle on. If there come to be a vortex of energy, so that which is not yet won might be won by human strength, by human energy, and by human striving."

We note that the emphasis is on the human base, from which it all begins. For that is how Dhamma arises as given in the Anguttara Nikaya: "Bhikkus, if you are asked by nonbelievers about the Dhamma, you shall answer them as follows: The root of Dhamma is will. All Dhamma arises whenever attention is focused thereon. All Dhamma appears through sense contact. All Dhamma combine through perception. All Dhamma culminate in the Jhanas. All Dhamma are by attention-ness controlled. All Dhamma are by wisdom overcome. All Dhamma have release as goal. All Dhamma are in deathlessness submerged. All Dhamma end in Nibbana".

12
It would seem that in Buddha's discourse to Ananda, the fundamental teaching is the rejection of any self as a doctrine and a technique for annihilation. It however, does not need much insight to comprehend that what is implied is the extinction of the five aggregates (Lokaya dhamma) as signified by the human, celestial Brahma, and Arupa brahma forms.

This becomes obvious at once when the lines which follow are perceived: "This is a way by which impure conditions can be put away and pure conditions brought to cease and therein abide."

What are impure conditions? The root of evils of delusion (moha), lust (dosa), and greed (lobha). What are wholesome things? The Noble Path, called the best of paths because unlike all other paths, it leads to emancipation of mind.

'Putting away' or cessation, in Buddha's sense, never implies decrease but increase. There is no annihilation of a conscious subject, or such nonsense as 'dewdrop sinking into sea'.

By each enunciated one has his own supersensate field of radiant personality, the end result of an acme accumulation of Parami, the perfections of experience, which are by no means extinguished at death. As it is said: "Even here and now, in the present body (not to mention after death thereof) that essential emancipated consciousness which is the 'Arahata remains unplumbed. And although this is what I teach, there are those who falsely accuse me of proclaiming a doctrine which is annihilationist."

As of old, so now, I proclaim only this: suffering and the cessation of suffering'.

And, again in the discourse to Nigrodha: 'All corruption shall be put away and wholesome things brought to increase'. And once this increase (namely, wisdom and insight) is attained (by supernormal concentration) there is the abiding by it. Cessation therefore, even if it is difficult of concentration, is never the extinction of a conscious subject. On the contrary, it is a gradual build up of potential, by intensifying steps.

'Great becomes the fruit, great the advantage of concentration when it is encompassed by morality. Great the fruit and advantage of wisdom when encompassed by concentration. The mind encompassed by wisdom is set free from the delusions'.

The "function of morality is to purify, if concentration's to penetrate, of wisdom to liberate. In that they are in unity and they do not prosper without each other's support. For morality devoid of concentration conducts to delusion. Concentration devoid of morality conducts to dangerous inflation, whereas wisdom devoid of concentration conducts to deficiency of mind control. When it is recommended to sink the peripheral faculties down into the aggregates (spheres) of Sia, Samadhi and Panna, at diaphragm pit, the intention is to push the faculties (bhavana) to their logical and ultimate culmination, namely the attainment of the supersensate and the release, also known as 'knowledge finality' (Anuttavaditvā).

The twenty two potential faculties commencing with the potential faculties of vision (Gakkhuddiyā), come into play in this unfolding cultivation (bhavana) process as controlling guides.

They are expedited to transmute raw material into refined product, a process which can reach its fullest peak only at this most vital of centers in the diaphragm pit,
other wise known as the 'heat base' (Haddaya Vatthu). It is termed so in that the aggregates of perception, memory, thought, and knowledge emerge there from.

Centered there are the faculties called (Ceo-samadhi, 'heart-concentration'). It is only at this focal point that the mundane faculties are able to emerge and come out (through transmutation process) the release faculties (Ceo-Vimutti) that are supramundane. Now when the faculties have penetrated the spheres of morality concentration, and wisdom (significant of the path) in successive style, the sphere of release (Vimutti) appears. Release from what? Release from the aggregate of the crude human form (Marussa kayama). It is release in the sense of passing from and transcending (for the moment) that particular level or stage of aggregates. Having been release therefrom in this style, it perceives its release (Vimutta Puttana dassana).

Whereupon the next formation appears. In this instance is the defined human counterpart (Marussa kayu Panniti, otherwise known as the 'astral'. To understand what this refined human counterpart is, it is necessary first to comprehend how it comes to exist at all. It comes to exist through the process of contact (Pahasa), of impression, and of intensification. As soon as a child is born, its very physicality serves as the base for psychoformative reproduction, for the human organism is not merely a consistency of dead cell. It is this active potentiality which contains in it the germ of psycho-physical replication.

Now the 'field-of-form' in which all the psycho-physical activities are activated inevitably partakes of the characteristic feature and form derived from the original base of crude materially being 'stamped', as it were and sustaining the impress thereof. Each form, derived in this replicative style, serves as the base for further development in turn, like an each reed in its invented sheath. The human organism, from the moment of birth, in its ceaseless impressionistic psycho-physical interplay of reciprocity (Samamana), thus serves as the base of 'template' for the intensification of continuous refinement in inviolate style. Form (rupa) impressed with feeling (vedana), and feeling with the sense of form, aggravates to immediate consciousness (Vijanana), by the supporting imagery of perception (Citta) and memory (Cittavijana).

In the shuddhārtha, this refined human counterpart is not classified in its formal (kaya) but in its psychological aspect (Citta) as a resultant (Vipaka). It is to be noted, therefore, that this particular formation is to be regarded as psychic in content, although images of crudely derived materiality linger therein.

It is classified in the sensual sphere of origination (kamavacara) and does not rise above that status. Being entered by the attachments peculiar to the sense-sphere of existence, its psychic supports (Karananana) determines its status quo.

Now the potential faculties pass from the crude form and impermeate this refined human counterpart, thus experiencing activity therein.

It is then innated to penetrate in mindfulness (Satipathana) for the further development of the path, as signified by the spheres of morality concentration, and wisdom, and as release (Vimutti) from the refined human aggregate, and the perception thereof (Vimutti Nama Dassana). Whereupon is the next stage, the crude celestial form or aggregate (Dibba kayana) appears. It cannot be too often repeated so that each successive form or sphere through the intensification of 'smelling' (Bhāvana)
which is a creative process and a replicative force pushes to ever increasing degree of refinement. Each successive form is established with a path (signified by the spheres of morality, concentration, and wisdom), and since the celestial aggregate is a more refined product than the human, its path too is correspondently more refined and so forth for all that follows. This, then, is what is implied by the obscure utterance: "Self is the refuge of Self".

Namely, through contact (Phassa) each antecedent form (self) serves as the 'impulse' for the production of a more refined one, which again serves as the base for the next. All of which are only subtle reproduction of the five basic aggregates of personality (Paṭecupadānakkhandha) which go to fashion existence in the mundane (Lokiyas)phere.

The crude celestial form (Dibbakaya Hitu) and its refined counterpart (Dibbakayaparittā) are products of the refined human form as base. They come to exist through the same intensification process of imprecise and pernicious abasing. Nature knows little limit in its potential capacity for refinement, which can be either instigated deliberately (as in the Jhānic method alluded to here), or by the mere force of meritorious living. It is to be understood that a meritorious life lived is not a mere desultory drifting to nothingness and dissolution but an activity which brings psychic fruit, brought about by the gradual accumulation and retention (Tadarammatana) of wholesome (kusala) impulses from psychic moment. Is the Abhidhamma this embodiment of the celestial aggregate is classified as beneficial (kusala), but like the refined human form it does not rise above the level of sensual attachments peculiar to the sensual sphere (Kamasatara). The other forms which follow from the celestial aggregate as base, are the Brahman form (Brahma kaya Hitu) and its refined counterpart (Brahma kaya Pañña). Unlike the celestial aggregate, these Brahman forms do not arise merely through meritorious living as such, but have to be deliberately instigated (by Jhānic concentration).

Only those who practice Jhāna (whether by concentration or anyone of the Kasinas, or on such states of mind as compassion etc.) attain this formal embodiment, which surpasses the sensual sphere.

In the Abhidhamma, this embodiment is classified in the form sphere (Rupasatara), due to its absorption in formal states and because materiality is still present. Its emotional and psychic supports (Arammanas), however, are of Jhānic content, based on equanimity or bliss, as the case may be.

From the refined Brahman form as the base the Arupa-Arhat form and its refined counterpart are produced because of being proficient in the absorptions of formlessness (Arupathama) which could be either the experience of the infinity of space, the infinity of consciousness, voidness, or neither perception nor non-perception. In the Abhidhamma, this embodiment is classified in the formless sphere (Arupasatara) because materiality is no longer present and because of the intangibility of its psychic supports. It would be misleading, however, to infer from this that the conscious-subject is formless as such. It is the support which is formless as the subject is endowed with form which is comprised of the cognitive element (Vinnana-dhatu). It is to be noted that consciousness (Vinnana) is one of the four terms of moment
BULLETIN OF TIBETOLOGY

(Alharah), and in the Dependent Origination Process (Paticca Samuppada), it is consciousness (Vinnanaat) which serves as the base for the arising of immateriality-materiality (Sama-rupa). It (Vinnanaat), therefore, is to be reckoned as a quality with the capacity once its exhaustion of meritorious potential is the upper planes has culminated. These celestial and Brahmans are not expedient but to be reborn, and once relinked by human birth, discerned the new life which arise. These aggregates of personal, however, continue to exist in the life continuum substrata (Bhavaanga) at diastragram pis. They are to be understood at resultant levels (Vipaka), whose function is only threefold: departing consciousness (Cari), as retarding consciousness (Patisaddhi), and at life continue substrata (Bhavaanga). It is a matter to be investigated that experience is not confined to the human level of consciousness, but there also exist in latency (plato's theory of forms) other aggregates to support the aspirant for release from mundane limits, because in the first place consciousness aspires for release only after it has had a turber thereof. As long as the hunger for mundane delight (as well as celestial bliss) remains, so long does the tendency to release fail to present itself. Only he who has his fill of mundane things at the all inclusive level of human, celestial, Brahma, and Arupa-Brahma attainments, an urge for higher things arise because it would be useless to speak of such higher things to one who has not yet had his fill. That is why it is said that there are creatures who delight in becoming, and when they hear of putting a stop to becoming their minds do not respond to it. "Young men, in the search for selfhood, which one would be better. To go in search for a woman or to go in search for yourself." With the statement we have arrived at this point of the Arupa-Brahma aggregate. But, like the other aggregates passed earlier, it is merely a higher level of the mundane personality (Upadakkhandha) and cannot be identified as the permanent refuge and an isle of self, or in any way can it be established as such, because it also decays and dies.

A man becomes a Deva, a Brahma, or an Arupa-Brahma deity only because he worked from the human level as base and at death he would be elevated to the upper plane. To be satisfied with the attainment of the Arupa-Brahma plane as something with self-sufficiency would be unwillingly to say the least, considering that the wheel of birth and death roll on. The problem of discovering the root and base of all these offshoots of personality, laboured under the delusion of an eternal self, remains. It is said, 'no opening' can be discovered by creatures, mixed in ignorance who are haunted by a thirst for becoming and who stray and wonder. The 'no opening' referred to here is the Anatta process of split-personalization, leaving no trace of the split-origin (already discussed in the chapter on Anatta), of the amorphous plurality which comes about through the dependent origination (Paticca Samuppada) process. This is why we witness Buddha has kept a noble silence on whether the self exist after death or does not exist after death. It one sense it does, in
on another sense it doesn’t, because the whole truth of it is inextricably bound up in the anica-anatta process of split-personality.

However, when the Arupa-Brahma aggregate is pushed on to the dead centre, and on to the spheres which signify the path; a more refined form called the Dhammakaya Gotrabhù is manifested (Psout’s receptacle) is always necessary as a passive conditional matrix of emptiness (Nathi Paccaya) wherein the causal seed may be sown before any result (Vipakapaccaya) may issue forth. It is in this passive matrix or receptacle, that the determining force of will is put and pushed.

The will (Cetana) or the controlling faculties (Indriya paccaya) is not enough. It must possess some antecedent ‘material’ on which to work, so that what is merely in the state of potentiality may become actuality. In the case of these forms and spheres of ever increasing refinement, each antecedent form or sphere of the same nature serves as the material (Athara Paccaya) which is smelted down by will into the voidness at its centre, wherein a refined counterpart of it appears. Only in the light of this does the injunction ‘self is the refuge of self’ become clear. For an antecedent ‘self’ is harnessed as the base for the production and emergence of a more refined one, until all sense attachment to mundane residues are purged.

All Dhammakaya forms are release (Visuddhi) forms, in contrast to the mundane forms which are only of temporary (Sammuti) usage. Unless the realese forms are attained, emancipation from the mundane sphere of things remains an impossibility.
because the mundane forms are so crude to comprehend in totality the Noble Truths, the characteristics of mutability, suffering, impersonality, and the way to transcend them.

Vipasana (penetrative insight) begins only when the Dhammakaya Gotrabha (transition of lineage from mundane to supramundane) is attained. Samantha (Jhanic tranquility) carries consciousness up to the aupa Brahma state and there it reaches its limit. That is why Yopis of ancient times were unable to penetrate into the process of Dependent Origination (Paccaya Sam uppada) by which personalities arise. Surpassing the domain of Samatha, Buddha arrived at Gotrabha Navi (transition of lineage in sight). By the Dhammakaya form impregnated with consciousness, he took stock of all that which goes to compose the mundane. Before Buddha there was only Samatha, Vipasana begins with the Buddha. The Dhammakaya forms are called 'release' (Vinupta) forms because they have become so refined that no attachment remains, and therefore they are the vehicles of emancipation. They are expeditious to review mundane aggregates, to observe the crudity therein, and to attain emancipation therefore. This process (of a more refined form observing the crudity in a lesser form) is a necessary process, because it is not in the power of a crude form to comprehend the refinement in a higher form, or to jump immediately thereto. The process is not confined to an observation of the human aggregates. And this is so, because if the observation is confined merely to the human level of aggregates then all that the mind will be emancipated from is the human aggregates, when as a matter of fact there are other subtler levels of a more insidious nature to be emancipated from.

The process by which his takes place is through an objectification technique. Consciousness is not only capable of objectifying itself, but is by its very nature a matter of divisibility. If this were not so, then it would never be able to observe itself. At any moment of time, it is always a posterior aggregate of consciousness which observes an anterior one. One group of percepts is always observing another group. The word 'itself' is misleading because it is only one group of aggregates which is being observed and not the totality thereof. This is one reason why it is said that all phenomena are characterized by a series of not self (Anatta). To say, at any one time, that it is the same 'self' is not correct. To say, again that it is a different 'self' is also not correct. There are states of awareness which arise and perceive other states. States arise and states vanish, aggregates appear and aggregates disappear. The psychic process is a series of looking back, looking front and looking around. They are its very nature, and they only becomes more refined the higher it proceeds in the attainment (Samapattii) scale. Although it is a natural process for one moment of consciousness to reflect upon another, it is never carried to such lengths as in this flexibility of penetrative insight called Vipassana. It is due to the identification with a certain moment of consciousness that man (by that moment) becomes ensnared. Feelings and reactions arise by the second. Mind control has remained a dream. In the average man, the aggregates of experience (Sankhara) are in such a state of confusion and disunity that they prevent the exact perceptive faculty. Only when the mind is centralized by the Samatha Vipassana technique and purged thereby, does it become keen enough to observe psychic phenomena with ease. This is also the method by which detachment (Upakilada) is at-
tained.

The problem of the practitioner of Samaṇa Vipassana is to unify whatever levels or aggregates of consciousnesses there may be and to harness them into service so as to make available to perceptive immediacy at a moment's notice. Once this faculty of transition from the cruelest level to the most refined has been attained, it can be said that the practitioner is in command of his faculties and is an adept in the concentrated absorption of mundane and supramundane states of consciousness.

It is to be observed that the term 'mystic' is not applied to these states, for there is nothing amorphous or dreamy about them. On the contrary they are very precise and clear cut. For if not precise and clear cut as they are, there would surely be no release from the ceaseless round of birth and death. When face with the refinements of mind there is no adequate terminologies to express it. The Pali terms of Manas, Citta, Vinnana are scarcely adequate to express the various aspects of mind, capable as they are of being pushed to translucent limits. Consciousness is not only passive, it is also active. It perceives, become aware, and cognizes at the different levels of refinement. All of which involves a thorough comprehension of the mind instants and the analysis of what extend the pannut of conscious states is resultant (Vipaku), functional (Kriya), or volitional (Javana).

It is to be understood, therefore, that Vipassana involves something more than mere desultory human awareness. The confusion has been to assume the mindfulness (Satipatthana) at the human level of consciousness as Vipassana. Satipatthana is vigilance of mind which is a basic necessity of awareness whether in or out of Jhana. It is not to be transmuted immediately into the highest perceptive insight of Vipassana Nana.

It is said that the Dependent Origination (Paticca Samuppada) process in direct order (Anuloma), commencing with ignorance as a condition (Uvitapaccaya sankhara), is also complemented by an inverted (Panioma) cessation (Nirodha) process, commencing with the removal of ignorance (bhutaya t'era ases-tiraga-viraga nerodha sankhara-nirodho).

This is so because when ignorance is removed through morality, concentration, and wisdom, then the offshoots (jutuputta) of split personality (anatta) or aggregate composites (Sankhara) as another terms are removed as a consequence. That is, through concentration they are controlled to a point (at diaphragm pit), and smothered out whatever defilements there are, whereby all conflicting impulsion are put to rest, unified, integrated, purged, and ceased, leaving no remainder (Upadesa) and no further issue. Thus put to an end, there is no subsequent base (Paccaya) for the arising of rebirth consciousness (Vinnana), name and form (Nana-rupa), and all the rest.

The Satipatthana Sutta concludes with the promise:- 'Verily, O Bhikkhus, whoever practices these four foundations of mindfulness (or formations, feelings, thoughts and mental objects) in this manner for seven years, seven months and seven days, then one of these two four-the highest knowledge (Achatana) or the state of non-returner (Anagamani) may be expected by him. This is the only way, O Bhikkhus, which lead to the purification of creatures, to pass beyond sorrow and lamentation and to realize Nibbana through the four foundations of mindfulness'.

The problem of Arahatta and Anagamini in the world is not due to any lack of
practise, but due to a fundamental misunderstanding of Buddha's promise. First of the misunderstanding came from ignorance of the method of inverted technique whereby each level of form, feeling, thought, mental essence is observed not at generally understood but by confining itself to the human level alone. Second of the misunderstanding is that Buddha was speaking from the specific context of certain period of history by knowing through supernormal insight that many possessed the faculties to be for attainment. This promise cannot be converted at this juncture to mean all and sundry.

Although attainment is something dependent on individual maturity the path to enlightenment is nevertheless always open to all. Before his final passing away to Nibbana, Buddha thus said to Subhadda who was the last of the converters: "Subhadda, if bhikkhus were to live rightly (Samma Viharetayaṃ) the world would not be void of emancipated Ones."

The right living as already stated, begins and ends with right understanding (Sammadittha) and right concentration (Samma Samadhi).
